National Standard of Canada

Canada

Experience and excellence
Expérience et excellence

The CANADIAN GENERAL STANDARDS BOARD (CGSB), under whose auspices this National Standard of Canada has been developed is a government agency within Public Works and Government Services Canada. CGSB is engaged in the production of voluntary standards in a wide range of subject areas through the media of standards committees and the consensus process. The standards committees are composed of representatives of relevant interests including producers, consumers and other users, retailers, governments, educational institutions, technical, professional and trade societies, and research and testing organizations. Any given standard is developed on the consensus of views expressed by such representatives.

CGSB has been accredited by the Standards Council of Canada as a national standards-development organization. The standards that it develops and offers as National Standards of Canada conform to the criteria and procedures established for this purpose by the Standards Council of Canada. In addition to standards it publishes as national standards, CGSB produces standards to meet particular needs, in response to requests from a variety of sources in both the public and private sectors. Both CGSB standards and CGSB national standards are developed in conformance with the policies described in the CGSB Policy Manual for the Development and Review of Standards.

CGSB standards are subject to review and revision to ensure that they keep abreast of technological progress. Suggestions for their improvement, which are always welcome, should be brought to the notice of the standards committees concerned. Changes to standards are issued either as separate amendment sheets or in new editions of standards.

An up-to-date listing of CGSB standards, including details on latest issues and amendments, and ordering instructions, is found in the CGSB Catalogue, which is published annually and is available without charge upon request. An electronic version, ECAT, is also available. More information is available about CGSB products and services at our Web site — www.ongc-cgsb.gc.ca.

Although the intended primary application of this standard is stated in its Scope, it is important to note that it remains the responsibility of the users of the standard to judge its suitability for their particular purpose.

The testing and evaluation of a product against this standard may require the use of materials and/or equipment that could be hazardous. This document does not purport to address all the safety aspects associated with its use. Anyone using this standard has the responsibility to consult the appropriate authorities and to establish appropriate health and safety practices in conjunction with any applicable regulatory requirements prior to its use. CGSB neither assumes nor accepts any responsibility for any injury or damage that may occur during or as the result of tests, wherever performed.

Attention is drawn to the possibility that some of the elements of this Canadian standard may be the subject of patent rights. CGSB shall not be held responsible for identifying any or all such patent rights. Users of this standard are expressly advised that determination of the validity of any such patent rights are entirely their own responsibility.

Further information on CGSB and its services and standards may be obtained from:

The STANDARDS COUNCIL OF CANADA is the co-ordinating body of the National Standards System, a federation of independent, autonomous organizations working towards the further development and improvement of voluntary standardization in the national interest.

The principal objectives of the Council are to foster and promote voluntary standardization as a means of advancing the national economy, benefiting the health, safety and welfare of the public, assisting and protecting the consumer, facilitating domestic and international trade, and furthering international co-operation in the field of standards.

A National Standard of Canada is a standard which has been approved by the Standards Council of Canada and one which reflects a reasonable agreement among the views of a number of capable individuals whose collective interests provide, to the greatest practicable extent, a balance of representation of producers, users, consumers and others with relevant interests, as may be appropriate to the subject in hand. It normally is a standard that is capable of making a significant and timely contribution to the national interest.

Approval of a standard as a National Standard of Canada indicates that a standard conforms to the criteria and procedures established by the Standards Council of Canada. Approval does not refer to the technical content of the standard; this remains the continuing responsibility of the accredited standards-development organization.

Those who have a need to apply standards are encouraged to use National Standards of Canada whenever practicable. These standards are subject to periodic review; therefore, users are cautioned to obtain the latest edition from the organization preparing the standard.

The responsibility for approving National Standards of Canada rests with the:

Standards Council of Canada

CANADIAN GENERAL STANDARDS BOARD

ORGANIC PRODUCTION SYSTEMS

GENERAL PRINCIPLES AND MANAGEMENT STANDARDS

INTRODUCTION

I. Description

Organic production is a holistic system designed to optimize the productivity and fitness of diverse communities within the agroecosystem, including soil organisms, plants, livestock and people. The principal goal of organic production is to develop enterprises that are sustainable and harmonious with the environment.

CAN/CGSB-32.310, *Organic Production Systems — General Principles and Management Standards*, describes the principles and management standards of organic production systems.

CAN/CGSB-32.311, *Organic Production Systems — Permitted Substances Lists*, provides lists of substances that are allowed for use in organic production systems.

As in the case of all products sold in Canada, organic inputs and products derived from organic agriculture should comply with all applicable regulatory requirements.

II. General Principles of Organic Production

Organic production is based on principles that support healthy practices. These principles aim to increase the quality and the durability of the environment through specific management and production methods. They also focus on ensuring the humane treatment of animals.

The general principles of organic production include the following:

1. Protect the environment, minimize soil degradation and erosion, decrease pollution, optimize biological productivity and promote a sound state of health.
2. Maintain long-term soil fertility by optimizing conditions for biological activity within the soil.
3. Maintain biological diversity within the system.
4. Recycle materials and resources to the greatest extent possible within the enterprise.
5. Provide attentive care that promotes the health and meets the behavioural needs of livestock.
6. Prepare organic products, emphasizing careful processing, and handling methods in order to maintain the organic integrity and vital qualities of the products at all stages of production.
7. Rely on renewable resources in locally organized agricultural systems.

III. Organic Practices

Neither this standard¹ nor organic products labelled in accordance with this standard represent specific claims about the health, safety and nutrition of such organic products.

Management methods are carefully selected in order to restore and then sustain ecological stability within the enterprise and the surrounding environment. Soil fertility is maintained and enhanced by promoting optimal biological activity within the soil and conservation of soil resources. Weeds, pests and diseases are managed using biological and mechanical control methods, and cultural practices, including minimized tillage. Crop selection and rotation are important for managing nutrient cycling, recycling of plant and animal residues, water management, augmentation of beneficial insects to encourage a balanced predator–prey relationship, and the promotion of biological diversity, and ecologically based pest management.

¹ References throughout this document to “this standard” refer to CAN/CGSB-32.310, *Organic Production Systems — General Principles and Management Standards*.

Under a system of organic production, livestock are provided with living conditions and space allowances appropriate to their behavioural requirements, and organically produced feed. These practices strive to minimize stress, promote good health and prevent disease.

Organic products are produced and processed under a system that strives to preserve the integrity of the principles in this standard.

Organic practices and this standard cannot assure that organic products are entirely free of residues of prohibited substances and other contaminants, since exposure to such compounds from the atmosphere, soil, ground water and other sources may be beyond the control of the operator. The practices permitted by this standard are designed to assure the least possible residues at the lowest possible levels.

In the development of the standard, it was recognized that differences between Canada's agricultural regions require varying practices to meet production needs.

Apart from a small portion of agricultural commodities marketed directly from the farm to consumers, most products find their way to consumers via established trade channels. To minimize deceptive practices in the marketplace, specific measures are necessary to ensure that trade and processing enterprises can be audited effectively. Therefore, the regulation of a process, rather than a final product, demands responsible action by all involved parties.

CANADIAN GENERAL STANDARDS BOARD

**ORGANIC PRODUCTION SYSTEMS
GENERAL PRINCIPLES AND MANAGEMENT STANDARDS****1. SCOPE**

- 1.1 Foods and other agricultural products shall refer to organic production methods only if they come from a farm system employing management practices that seek to nurture ecosystems in order to achieve sustainable productivity; and that provide weed, pest and disease control through a diverse mix of mutually dependent life forms, recycling of plant and animal residues, crop selection and rotation, water management, tillage and cultivation.
- 1.2 This standard applies to the following products that carry or are intended to carry descriptive labelling referencing organic production methods:
- a. unprocessed plants and plant products, livestock and livestock products, to the extent that the principles of production and specific verification rules for them are described in the standard
 - b. processed agricultural crop and livestock products intended for human consumption derived from the items mentioned in par. 1.2 a.
- 1.3 A product will be regarded as bearing indications referring to organic production methods where, in the labelling or claims, including advertising material or commercial documents, the product or its ingredients are described by the terms *organic*, *biodynamic*, *biological* and *ecological* or by words of similar intent, including diminutives, which suggest to the purchaser that the product or its ingredients were obtained according to organic production methods.
- 1.4 Par. 1.3 does not apply where these terms clearly have no connection with the products mentioned in par. 1.2.
- 1.5 The requirements in this standard complement Canadian health, environmental, agricultural, feed and food regulatory requirements.
- 1.6 Quantities and dimensions in this standard are given in metric units with yard/pound equivalents, mostly obtained through soft conversion, given in parentheses. The metric units shall be regarded as official in the event of dispute or unforeseen difficulty arising from the conversion.
- 1.7 All inputs used in organic production such as fertilizers, feeds, pesticides, soil amendments, veterinary treatments, processing additives or aids, sanitizing and cleaning material, and any other production input shall be approved by the appropriate government regulatory agency for the products' intended use, where regulations govern the use of such inputs.
- 1.8 **Prohibited Substances, Methods or Ingredients in Organic Production and Handling**
- 1.8.1 When producing or handling organic products sold or labelled as being products whose content is partially or wholly organic, it is forbidden to use any of the following substances or techniques:
- a. all materials and products produced from genetic engineering as these are not compatible with the principles of organic production (growing, preparing and selling) and therefore are not accepted under this standard
 - b. synthetic pesticides (e.g. defoliant and desiccants, fungicides, insecticides and rodenticides), wood preservatives (e.g. arsenate) or other pesticides, except as specified in CAN/CGSB-32.311

- c. fertilizer or composted plant and animal material that contains a prohibited substance (not included in CAN/CGSB-32.311)
- d. sewage sludge, in any form, as defined in this standard, as a soil amendment
- e. synthetic growth regulators
- f. synthetic allopathic veterinary drugs, including antibiotics and parasiticides, except as specified in this standard
- g. synthetic processing substances, aids and ingredients, and food additives and processing aids including sulphates, nitrates and nitrites, except as specified in CAN/CGSB-32.311
- h. ionizing radiation and forms of irradiation on products destined for food or their inputs, as defined in this standard, except as specified in CAN/CGSB-32.311
- i. equipment, packaging materials and storage containers, or bins that contain a synthetic fungicide, preservative or fumigant
- j. substances that are not included in CAN/CGSB-32.311, except as provided by this standard

1.8.2 The same ingredient in both an organic and non-organic form shall not be present in an organic product.

2. REFERENCED PUBLICATIONS

2.1 The following publications are referenced in this standard:

2.1.1 Canadian General Standards Board (CGSB)

CAN/CGSB-32.311 — Organic Production Systems — Permitted Substances Lists.

2.1.2 Canadian Food Inspection Agency (CFIA)

Health of Animals Act (1990, c.21)

Health of Animals Regulations (C.R.C., c. 296).

2.1.3 Health Canada

Pest Control Products Act (R.S. 1985, c. P-9)

Food and Drug Regulations (C.R.C., c. 870).

2.2 A dated reference in this standard is to the issue specified. An undated reference in this standard is to the latest issue, unless otherwise specified by the authority applying this standard. The sources are given in the Notes section.

3. DEFINITIONS AND TERMINOLOGY

3.1 The following definitions and terms apply in this standard:

Agricultural Product (Produit agricole)

An animal, a plant, an animal or a plant product, or a product, including any food or drink wholly or partly derived from an animal or a plant.

Agroecosystem (Agroécosystème)

A system consisting of the form, function, interaction and equilibrium of the biotic and abiotic elements present within the environment of a given agricultural enterprise.

Allopathic (Allopathique)

Using allopathy.

Allopathy (*Allopathie*)

A method of treating disease with substances that produce a reaction or effects different from those caused by the disease itself.

Annual Seedling (Semis annuel)

A young plant grown from seed that will complete its life cycle or produce a yield and be able to be harvested within the same crop year or season in which it was planted.

Antibiotic (Antibiotique)

Various substances that contain any quantity of any chemical substance produced by a micro-organism, like penicillin, and that are used to inhibit or destroy the growth of micro-organisms to prevent or treat disease.

Apiculture (Apiculture)

The management and production of honeybees and queens and their products (e.g. honey, beeswax, pollen, royal jelly, propolis and bee venom).

Audit (Audit)

A systematic and functionally independent examination to determine whether activities and related results conform with planned objectives.

Audit Trail (Traçabilité)

A documentation control procedure that can determine the origin, transfer of ownership, and transportation process (i.e. supply chain) of any product labelled organic or containing organic ingredients.

Biodegradable (Biodégradable)

Capable of biological decomposition into simpler biochemical or chemical components.

Buffer Zone (Zone tampon)

A clearly defined and identifiable boundary area that borders an organic production unit and that may limit inadvertent application of, or contact with, prohibited substances from adjacent non-organic areas.

Certification (Certification)

The procedure whereby a (officially accredited) certification body provides written assurance that products or production systems conform to specified requirements. Certification of products may be based on a range of inspection activities including verification of management practices, auditing of quality assurance systems, and in/out production balances.

Certification Body (Organisme de certification)

The body directing the certification process. The certification body is responsible for verifying that a product labelled or sold as organic is prepared in accordance with this standard.

Certified Organic (Certifié biologique)

A designation that attests compliance with this standard.

Commercially Available (Offert sur le marché)

The documented ability to obtain a production input or an ingredient in an appropriate form, quality, quantity or variety in order to fulfil an essential function in an organic farming, preparation or handling system.

Commingling (Mélange)

Physical contact between bulk, unbound or unpackaged organic products and non-organic products during production, preparation, transportation, storage or handling.

Competent Authority (Autorité compétente)

An official government agency having jurisdiction.

Compost (Compost)

The product of a carefully managed aerobic process by which non-synthetic materials are digested by micro-organisms. Organic materials for compost shall be managed appropriately to reach temperatures for the duration necessary to effectively stabilize nutrients and kill human pathogens.

Compost Tea (Thé de compost)

A soil amendment solution created by steeping mature compost in order to promote beneficial bacterial growth.

Crop Rotation (Rotation des cultures)

The practice of alternating crops grown on a specific field in a planned sequence in successive crop years so that crops of the same species or family are not continuously grown on the same field. Perennial cropping systems employ techniques such as alley cropping, intercropping and hedgerows to introduce biological diversity in lieu of crop rotation.

Perennial Crop (*Culture vivace*)

Any crop, other than a biennial crop, that can be harvested from the same planting for more than one crop year or that requires at least one year after planting before harvest.

Drift (Dérive)

The physical movement of prohibited substances from the intended target site onto all or part of an organic farm.

Feed Additive (Additif pour alimentation animale)

A substance added to feed in small quantities to fulfil a specific nutritional need (i.e. essential nutrients in the form of amino acids, vitamins and minerals).

Feed Supplement (Supplément alimentaire)

A feed that is used with another feed to improve the nutritive balance of the total and that is intended to be fed undiluted as a supplement to other feeds; or offered free choice with other parts of the ration separately available; or diluted and mixed to produce a complete feed that is acceptable for registration.

Fertilizer (Engrais)

A single or blended substance composed of one or more recognized plant nutrient(s).

Food Additive (Additif alimentaire)

Food additive has the same meaning as in Section B.01.001 of Part B of the *Food and Drug Regulations*. However, in the context of this standard, food additives are limited to those substances listed in par. 6.4.1 of CAN/CGSB-32.311.

Food Irradiation (Irradiation des aliments)

A sanitation or preservative method for packaged or bulk foodstuffs that controls insect infestation and that reduces microbial load by ionizing radiation from Cobalt-60 or Cesium-137; or X-rays generated by a machine source operated at or below an energy level of 5 MeV; or from electrons generated by a machine source operated at or below an energy level of 10 MeV.

Forage (Fourrage)

Vegetative material in fresh, dried or ensiled state (pasture, hay or silage), which is fed to livestock.

Genetic Engineering (Génie génétique)

Refers to techniques by which the genetic material of an organism is changed in a way that does not occur naturally by multiplication and/or natural recombination. Examples of the techniques used in genetic engineering include but are not limited to

- recombinant DNA (rDNA) techniques that use vector systems
 - techniques involving the direct introduction into the organism of hereditary materials prepared outside the organism
 - cell fusion (including protoplast fusion) or hybridization techniques that overcome natural physiological, reproductive or recombination barriers, where the donor cells/protoplasts do not fall within the same taxonomic family
- Unless the donor/recipient organism is derived from any of the above techniques, examples of techniques not covered by this definition include
- in vitro fertilization;
 - conjugation, transduction, transformation, or any other natural process;

- polyploidy induction;
- cell fusion (including protoplast fusion) or hybridization techniques where the donor cells/protoplasts are in the same taxonomic family.

Handling (Manutention)

Any operation or portion of operation that receives or otherwise acquires agricultural products for resale, including final retailers of agricultural products, who process and transform, repack or relabel such products.

Herbivore (Herbivore)

An animal that feeds chiefly on plants.

Homeopathic (Homéopathique)

Using homeopathy.

Homeopathy (Homéopathie)

A treatment of disease based on the administration of minute doses of a substance that in massive amounts produce symptoms in healthy animals similar to those of the disease itself.

Ingredient (Ingrédient)

Any substance, including a food additive, used in the manufacture or preparation of a product. The substance is present in the final product, possibly in a modified form.

Label (Étiquette)

Any legend, word or mark attached to, included in, belonging to, or accompanying any product or package containing a product.

Livestock (Animaux d'élevage)

Livestock means any domestic or domesticated animal including bovine (e.g. buffalo and bison), ovine, porcine, caprine, equine, poultry and bees raised for food or in the production of food. The products of hunting or fishing of wild animals shall not be considered part of this definition.

Manure (Fumier)

Livestock feces, urine and other excrement, and bedding used (or soiled) by livestock and that have not been composted.

Non-synthetic (Non synthétique)

A substance derived from mineral, plant or animal matter that does not undergo a synthetic process as defined in accordance with this standard.

Nutrient Management Plan (Plan de gestion des nutriments)

A nutrient budgeting plan in which the timing and rate of nutrient application is based on soil nutrient status (soil test results), crop nutrient needs, amendment (manure, compost, plough-down crop or other permitted substance), nutrient contents and expected nutrient release rates. The goal of a nutrient management plan is to minimize nutrient loss, protect water quality, maintain soil fertility and ensure effective use of permitted soil amendments.

Operator (Exploitant)

Any person, firm or organization that produces, prepares or imports, with a view to the subsequent marketing of products referred to as organic.

Marketing (Commercialisation)

The holding or the display of a product for sale, such as offers for sale, selling, delivering or placing on the market in any form.

Organic Integrity (Intégrité biologique)

The maintenance of the inherent organic qualities of a product from the reception of ingredients through to the end consumer, in accordance with this standard.

Organic Product (Produit biologique)

Any commodity or output produced by a system conforming to this standard.

Organic Production (Production biologique)

A method of agricultural production, including any subsequent preparation, storage and transportation, conforming to this standard.

Parallel Production (Production parallèle)

The simultaneous production, preparation or handling of organic and non-organic (including transitional) crops, livestock and other organic products of the same or similar, visually indistinguishable varieties.

Permitted Substances Lists (Listes des substances permises)

Lists of substances maintained by the competent authority meeting the criteria described in section 11 for permitted use in accordance with this standard.

Pest (Organisme nuisible)

An organism causing damage to humans or to resources used by humans, such as some viruses, bacteria, fungi, weeds, parasites, arthropods and rodents.

Pesticide (Pesticide)

Any substance or mixture of substances intended to prevent, destroy, repel or mitigate any pests or plants.

Planting Stock (Matériel de reproduction végétale)

Any plant or plant tissue, other than annual seedlings but including rhizomes, shoots, leaf or stem cuttings, roots or tubers, used in plant production or propagation.

Preparation (Préparation)

Includes, in respect of an agricultural product, processing, slaughtering, storing, inspecting, grading, packing, assembling, pricing, marking and labelling.

Principal Display Panel (Support d'affichage principal)

That part of the label displayed or visible under normal or customary conditions of sale or use.

Processing Aids (Auxiliaires de production)

Substances that are added to a food for a technological effect during processing and that are not present in the finished food product or are present at insignificant and non-functional levels.

Production Unit (Unité de production)

A portion of an enterprise that produces an organic product under a specific management plan.

Prohibited Substance, Method or Ingredient (Substance, méthode ou ingrédient interdit)

A substance, method or ingredient proscribed by par. 1.8 of this standard.

Records (Registres)

Any information in written, visual or electronic form that documents the activities undertaken by a producer, a person engaged in the preparation of organic products, or a certification body in accordance with this standard.

Sewage Sludge (Boues d'épuration)

A solid, liquid or semisolid material formed as a precipitate from the treatment of liquid and solid human domestic waste, among other compounds, and accumulated predominantly in municipal and industrial sewage treatment facilities, sewers and drains. Sewage sludge includes, but is not limited to, domestic septage; scum or solids removed in primary, secondary or advanced wastewater treatment processes; or material derived from sewage sludge. Sewage sludge does not include ash generated during the firing of sewage sludge in a sewage sludge incinerator, or grit and screenings generated during preliminary treatment of domestic sewage in treatment facilities.

Split Production – Split Operation (Production fractionnée — Exploitation fractionnée)

An operation that produces, prepares or handles organic and non-organic agricultural products (including transition).

Synthetic Substance (Substance synthétique)

A man-made substance formulated or manufactured by a chemical process or by a process that chemically alters compounds extracted from plant, micro-organisms, and animal or mineral sources. This term does not apply to compounds synthesized or produced by biological processes, including heat and mechanical processing.

Transition (Conversion)

Set of steps taken by the operator of a non-organic production system to establish organic management practices, in accordance with this standard.

Transitional Period (Période de conversion)

The period of time between the start of an organic management program in a production unit and the attainment of organic status by a production unit, in accordance with this standard.

Transplant (Plant repiqué)

A seedling that has been removed from its original place of production, transported and replanted.

Veterinary Biologic (Produit biologique vétérinaire)

A helminth, protozoa or micro-organism; or a substance or mixture of substances derived from animals, helminths, protozoa or micro-organisms; or a substance of synthetic origin that is manufactured, sold or represented for use in restoring, correcting or modifying functions in animals or for use in the diagnosis, treatment, mitigation or prevention of a disease, disorder, abnormal physical state, or the symptoms thereof, in animals. Veterinary biologics include vaccines, bacterins, bacterin-toxoids, immunoglobulin products, diagnostic kits and any veterinary biologic derived through biotechnology.

Veterinary Drug (Médicament vétérinaire)

Any substance or mixture of substances represented for use or administered in the diagnosis, treatment, mitigation or prevention of disease, disorder, abnormal physical state or its symptoms in animals; restoring, correcting or modifying functions in animals.

Wild Crop (Plante sauvage)

Naturally growing plants in their natural habitat collected or harvested from a site that is not maintained under cultivation or other agricultural management.

4. ORGANIC PLAN

- 4.1 The operator of an enterprise shall prepare an organic plan outlining the details of transition, production, preparation, handling and management practices, in accordance with this standard.
- 4.2 The organic plan shall be updated annually to address changes to the plan or management system, problems encountered in executing the plan, and measures taken to overcome such problems.
 - 4.2.1 An operator in the process of converting an enterprise or a production unit to this standard shall have a written organic transition plan. The transition plan shall specify a time to bring the enterprise into complete transition (e.g. five years). Certification bodies can make exceptions for farms with different types of production.
- 4.3 The organic plan shall include a description of the internal record-keeping system, with documents sufficient to meet audit trail and record-keeping requirements.
- 4.4 **Record Keeping and Identification** — The operator seeking to comply with this standard shall maintain records and relevant supporting documents concerning the inputs, production, preparation and handling of crops, livestock and organic products that are or are intended to be sold, labelled or otherwise represented as organic in accordance with this standard. The operator shall guarantee the organic integrity of the product through a continuous audit trail, from the receipt of the raw material to release of the product.

- 4.4.1 Records shall make it possible to trace
- a. the origin, nature and quantities of organic products, as stated within this standard, that have been delivered to the production unit;
 - b. the nature, quantities and consignees of products, as stated within this standard, that have left the production unit;
 - c. any other information, such as the origin, nature and quantities of ingredients, additives and manufacturing aids delivered to the unit, and the composition of processed products, for the purposes of proper verification of the operations in accordance with this standard.

4.4.2 Records shall be maintained for not less than five years beyond their creation.

4.4.3 An identification system shall be provided for distinguishing organic and non-organic crops and livestock (e.g. general appearance, colour, variety and types), and their products and labels.

5. CROP PRODUCTION

5.1 Land Requirements for Transition to Organic

5.1.1 Products shall not be labelled or marketed as organic until this standard has been fully applied on a production unit for at least 24 months before sowing or in the case of perennial crops, at least three years before the first harvest of products. Prohibited substances shall not have been used for at least 36 months before the harvest of any crop.

5.1.2 The certification body may decide in certain cases to reduce the required transition period to 12 months when an enterprise can document that a production unit has been managed in accordance with the standard for 24 months before seeking certification. The certification body may also decide in certain cases to extend the transition period depending on previous land use.

5.1.3 The enterprise shall be under the supervision and verification of a certification body for at least the last 12 months of the transition.

5.1.4 Land that has not been cultivated for three or more years and crops and harvests that consist of naturally growing plants in their natural habitat (no prohibited substances applied) can be exempted from a transition period.

5.1.5 The enterprise shall aim at a complete transition of its production. During the transition period, the enterprise can maintain, in addition to the production in transition, a non-organic system of production (split operation) that shall be entirely separate and identified pending its incorporation into the overall transition process. Parallel production (where the products of the organic and non-organic system are indistinguishable) is not allowed. The enterprise can be converted one unit at a time, and each converted unit shall respect the requirements of this standard.

5.1.6 All production units shall have distinct, defined boundaries.

5.1.7 To prevent unintended contact with prohibited substances, buffer zones or other features may be required:

- a. Such features or areas are to be set on a case-by-case basis according to risk, as determined by the certification body.
- b. When required, buffer zones shall be 8 m wide, or wider, depending on the nature of the risk of contamination.
- c. Permanent hedgerows or plant windbreaks, artificial windbreaks, permanent roads or other features may be used instead of buffer zones.

5.1.8 Crops grown in buffer zones shall be considered non-organically grown products. If marketed, they shall be sold as non-organic. If brought onto the farm, they will also be considered non-organic.

5.1.9 Production units shall not be alternated between organic and non-organic production methods.

5.2 Environmental Factors

5.2.1 Measures shall be taken to minimize risks from neighbouring areas, including spray drift and exposure to, or contact with, substances not in accordance with this standard.

- 5.2.2 Soil erosion shall be controlled by good management practices such as appropriate cultivation practices, reduced tillage, planned water drainage and other controls, in accordance with the soil type, local conditions and crop.
- 5.2.3 The use of posts or wood treated with materials other than those in CAN/CGSB-32.311 is prohibited.
- a. Continued use and recycling of existing (prohibited) posts within the farm may be allowed with the permission of the certification body.
 - b. Acquisition of any additional material with these wood treatments is prohibited for new installations or replacement purposes. The certification body may grant exceptions in vast rangeland and semi-arid regions, and will consider the availability of alternate materials.
- 5.3 **Seeds and Planting Stock**
- 5.3.1 The operator shall use organic seed, bulbs, tubers, cuttings, annual seedlings, transplants and other propagules produced in accordance with this standard.
- 5.3.2 ***Exceptions or Conditions***
- 5.3.2.1 If the operator can demonstrate that an organically produced variety is not available from its enterprise or other sources (i.e. not commercially available), the certification body may authorize the use of non-organic untreated seed and planting stock or seed only treated with substances in accordance with this standard.
- 5.3.2.2 Non-organic perennial planting stocks may be used provided that the products from such plants shall not be labelled, marketed or represented as organic until the plants have been maintained in accordance with this standard for at least one year.
- 5.3.2.3 Plant varieties, seeds, seed inoculant, germ plasm, scions, rootstocks or other propagules developed through the use of genetic engineering are prohibited, in accordance with par. 1.8.
- 5.4 **Soil Fertility and Crop Nutrient Management**
- 5.4.1 The main objective of the soil fertility and crop nutrient management program shall be to establish and maintain a fertile soil using practices that maintain or increase soil humus levels, that promote an optimum balance and supply of nutrients, and that stimulate biological activity within the soil.
- 5.4.2 The fertility and biological activity of the soil shall be maintained or increased, where appropriate, by
- a. crop rotations, which shall be as varied as possible and include plough-down, legumes, catch crops or deep-rooting plants;
 - b. incorporating plant and animal matter that can be obtained from organic production in compliance with this standard and that include the following:
 - i. composted animal and plant matter
 - ii. non-composted plant matter, specifically legumes, plough-down crops or deep-rooting plants within the framework of an appropriate multiyear rotation plan
 - iii. non-processed animal manure, including liquid manure and slurry
- 5.4.3 The operator shall select and implement tillage and cultivation practices that maintain or improve the physical, chemical and biological condition of soil, that minimize damage to the structure and tilth of soil, and that minimize soil erosion.
- 5.4.4 The operator shall manage plant and livestock materials to maintain or improve soil organic matter content, crop nutrients, and soil fertility in a manner that does not contribute to the contamination of crops, soil or water, by plant nutrients, pathogenic organisms, heavy metals or residues of prohibited substances.
- 5.4.5 Except as provided in par. 5.5.1, the organic matter produced on the enterprise shall be the basis of the nutrient cycling program and may be supplemented with off-farm organic and non-organic nutrient sources specified in CAN/CGSB-32.311.

5.4.6 The operator shall not use burning to dispose of crop residues produced on the operation, except that burning may be used to suppress the spread of disease or to stimulate seed germination.

5.5 **Manure Management**

5.5.1 **Manure Sources** — The operator shall first use all available animal manure produced on the organic operation (on-farm) and then may use manure from other organic operations (off-farm). When manure from organic operations is not available in sufficient quantities, the operator may use manure from non-organic farm operations provided that

- a. the non-organic operation is not a fully caged and restricted movement or a land-detached livestock operation;
- b. the source is approved for use by the operator's certification body;
- c. if possible, the manure shall be composted before use.

5.5.2 **Land Application of Manure**

5.5.2.1 The essential elements of an organic manure application program shall address land area, rate of application, time of application, soil incorporation and retention of nutrient components.

5.5.2.2 All soil amendments including liquid manure, slurries, compost tea, solid manure, raw manure, compost and other approved substances shall be applied to land in accordance with nutrient management planning principles and, where applicable, according to the relevant provincial requirements.

5.5.3 **Timing of Manure Application**

5.5.3.1 Where manure is applied, the soil shall be sufficiently warm and moist to ensure active bio-oxidation.

5.5.3.2 In season, the timing, rate and method of manure application shall be designed to ensure that manure application

- a. does not contribute to the contamination of crops by pathogenic bacteria;
- b. minimizes the potential for run-off into ponds, rivers and streams;
- c. does not significantly contribute to ground and surface water contamination.

5.5.3.3 The fresh solid or liquid manure shall be

- a. incorporated into the soil at least 90 days before the harvesting of crops for human consumption that do not come into contact with soil;
- b. incorporated into the soil at least 120 days before the harvesting of crops having an edible part that is directly in contact with the surface of the soil or with soil particles.

5.6 **Crop Pest, Disease and Weed Management**

5.6.1 Pest, disease and weed control shall be centred on organic management practices aimed at enhancing crop health and minimizing losses caused by weeds, disease and pests. Organic management practices include cultural practices (e.g. rotations, establishment of a balanced ecosystem, and use of resistant varieties) and mechanical techniques (e.g. sanitation measures, cultivation, traps, mulches and grazing).

5.6.2 When the organic management practices alone cannot prevent or control crop pests, disease or weeds, a biological or botanical substance, or other substances in CAN/CGSB-32.311 may be applied. However, the conditions for using the substance shall be documented in the organic plan, in accordance with par. 1.8.

5.6.3 Application equipment (e.g. spray equipment) used for soil nutrient supplements, disease or pest management on the enterprise shall be cleaned thoroughly between applications to remove residues of applied substances. If products presenting a contamination risk have been previously applied with the equipment, equipment parts from which residue cannot be removed shall be replaced.

6. LIVESTOCK PRODUCTION

6.1 General

- 6.1.1 Livestock for organic production shall be raised according to this standard.
- 6.1.2 Livestock can make an important contribution to an organic farming system by
- a. improving and maintaining the fertility of the soil;
 - b. managing the flora through grazing;
 - c. enhancing biodiversity and facilitating complementary interactions on the farm.
- 6.1.3 Livestock production is a land-related activity. Herbivores shall have access to pasture, and all other animals to open-air runs; the certification body can approve exceptions when the physiological state, inclement weather conditions and state of the land so justify.
- 6.1.4 Livestock stocking rates shall recognize the differences between Canada's agro-climatic regions and take into consideration feed production capacity, stock health, nutrient balance and environmental impact.
- 6.1.5 Organic livestock management shall aim to utilize natural breeding methods, minimize stress, prevent disease, progressively eliminate the use of chemical allopathic veterinary drugs (including antibiotics), and maintain animal health and welfare.

6.2 Origin of Livestock

- 6.2.1 The choice of breeds, strains and breeding methods shall be consistent with the principles of this standard and, in particular, shall take into account
- a. adaptation of livestock to local conditions;
 - b. vitality and resistance of livestock to disease;
 - c. absence of disease and health problems specific to breeds or strains.
- 6.2.2 Livestock used for livestock products to be sold, labelled or represented as organic shall
- a. be born or hatched on production units conforming to this standard;
 - b. have been the offspring of parents raised under the conditions specified in this standard;
 - c. be raised under this system throughout their life except as follows:
 - i. Poultry used for edible poultry products shall have been from poultry that have been under continuous organic management, in accordance with this standard, beginning no later than the second day of life; birds shall not have been given medication other than antibiotic-free vaccines.
 - ii. Animals used for milk production shall have been under continuous organic management, in accordance with this standard, for at least one year before the milk can be sold, labelled or represented as organic.
 - iii. Animals used for meat shall have been under continuous organic management, in accordance with this standard, from the beginning of the last third of the gestation period (of the dam).
- 6.2.3 Animals purchased for breeding shall be from organic enterprises. By way of derogation, when it can be shown that suitable organic breeding stock are not available, non-gestating breeder animals and breeding males may be brought from a non-organic operation onto an organic operation and integrated into the organic system. However, the meat from such animals shall not be sold as organic. Livestock from non-organic sources shall not be resold as organic breeding stock if raised as organic for less than 12 months.
- 6.2.4 All livestock or edible livestock products that are removed from an organic enterprise and subsequently managed on a non-organic enterprise shall not be sold, labelled, or marketed as organically produced, in accordance with this standard.

6.3 **Transition to Organic**

- 6.3.1 When an entire dairy herd is being converted to organic production, the operator shall,
- in the first nine months of the transition year, provide a minimum of 80% feed, calculated by dry matter, that is either organic or raised from land included in the organic system plan and that is managed in accordance with organic crop requirements;
 - in the final three months of the transition year, provide only organic feed conforming to this standard.
- 6.3.2 The transition of the land intended for feeding crops or pasture shall comply with par. 5.1.
- 6.3.3 The certification body may reduce the transition periods in the following cases:
- For pasture, open-air runs and exercise areas used by non-herbivore species.
 - During the final year of transition, animal feed and pasture of the enterprise can only be used as organic by the production unit of the enterprise. The feed shall not be sold or used as organic outside of this unit.

6.4 **Livestock Feed**

- 6.4.1 The operator of an organic livestock operation shall provide livestock with an organic feed ration balanced to meet their nutritional requirements. During an emergency (such as unforeseen severe events or extreme climatic conditions), an exception to this specification may be allowed so that the livestock are provided a balanced diet. In such cases, a request for exemption shall be submitted to and approved by the certification body. The request shall include specific dates and a plan for reversion to a ration produced in accordance with this standard. The maximum percentage of allowable non-organic feed and any conditions relating to this exception shall be set by the certification body. Non-organic feed shall conform to the requirements of par. 1.8.
- 6.4.2 Livestock feed shall consist of substances that are necessary and essential for maintaining the animals' health, well-being and vitality and that meet the physiological and behavioural needs of the species in question.
- 6.4.3 Specific livestock rations shall take into account the following:
- for young mammals, the need for natural milk
 - for herbivores, that a substantial proportion of dry matter in daily rations consists of roughage, fresh/dried fodder or silage
 - for ruminant animals, when silage is fed, dry roughage is provided
 - for poultry, the need for grains in the fattening phase and for roughage and fresh/dried fodder or silage in daily rations
 - for pigs, the need for roughage, fresh/dried fodder or silage in daily rations
- 6.4.4 The operator of an organic operation shall not provide organic livestock with
- feed and feed additives, including amino acids and feed supplements that contain substances not in accordance with CAN/CGSB-32.311;
 - feed medications or veterinary drugs, including hormones and prophylactic antibiotics, to promote growth;
 - approved feed supplements or additives used in amounts above those required for adequate nutrition and health maintenance for the species at its specific stage of life;
 - feeds chemically extracted or defatted with prohibited substances;
 - mammalian or avian slaughter by-products;
 - synthetic preservation and colouring agents;
 - silage preservation products except for products listed in CAN/CGSB-32.311;
 - synthetic appetite-enhancers or synthetic flavour-enhancers;
 - feed formulas containing manure or other animal waste.
- 6.4.5 Animals shall be provided with clean fresh water on demand.

- 6.5 **Breeding** — Breeding methods shall conform to the principles of organic production in this standard. The operator shall
- a. select breeds and types of livestock that are suitable for site-specific conditions within the local environment and production system and that are resistant to prevalent diseases and parasites;
 - b. use natural methods of reproduction; however, artificial insemination is permitted;
 - c. not use embryo transfer techniques or breeding techniques using genetic engineering or related technology;
 - d. not use reproductive hormones to trigger and synchronize estrus.
- 6.6 **Transport and Handling**
- 6.6.1 Livestock shall be managed responsibly with care and respect. Stress shall be minimized in all handling practices.²
- 6.6.2 The transport and slaughter of livestock shall be managed to minimize stress, injury and suffering. The use of electrical stimulation or allopathic tranquilizers is prohibited.
- 6.6.3 The animals shall have suitable shelter against inclement weather conditions (e.g. wind, rain, excessive heat and cold) during transportation and before slaughter.
- 6.6.4 Efforts shall be made to transport animals directly from the farm to their final destination.
- 6.6.5 The duration of transportation shall be as short as possible.
- 6.6.6 Animals too ill to be transported shall be suitably euthanized, without cruelty.
- 6.7 **Livestock Health Care**
- 6.7.1 The operator shall establish and maintain preventive livestock health care practices, including
- a. the choice of appropriate breeds or strains of animals, as specified in par. 6.2.1;
 - b. the provision of a feed ration sufficient to meet nutritional requirements, including vitamins, minerals, protein, fatty acids, energy sources and fibre (ruminants), in accordance with this standard;
 - c. the establishment of appropriate housing, pasture conditions, space allowance and sanitation practices, to minimize crowding and the occurrence and spread of diseases and parasites;
 - d. the provision of conditions that allow for exercise, freedom of movement, and a reduction in stress appropriate to the species;
 - e. the provision of prompt treatment for animals with detectable disease, lesions, lameness, injury and other physical ailments;
 - f. the administration of vaccines in accordance with this standard when it has been documented that the targeted diseases are communicable to livestock on the enterprise and cannot be combatted by other means.
- 6.7.2 Surgical procedures, when absolutely necessary to improve the health, welfare or hygiene of animals, or for identification or safety reasons (e.g. tail docking, teeth trimming, beak trimming, castration [including banding], branding, ear tagging and dehorning) shall be performed at the youngest age possible (in most cases under two weeks) and by competent persons. Surgical procedures shall be undertaken in a manner that minimizes pain, stress and suffering, with consideration to the use of anesthetics and sedatives.
- a. Beak trimming and de-toeing of birds is prohibited unless all other efforts to control problem behaviour have proven unsuccessful. When these procedures are necessary, farmers shall obtain permission by making a written request to the certification body, outlining the measures taken to eliminate this behaviour.
 - b. Tail docking of pigs is prohibited except to control tail biting and shall be permitted only when all other efforts to eliminate this behaviour have proven unsuccessful. When tail docking is necessary, farmers shall obtain permission by making a written request to the certification body, outlining the measures taken to eliminate this behaviour.
 - c. Tail docking of cattle is prohibited except when necessary for veterinary treatment of injured animals.

² See also the Health of Animals Regulations under the Health of Animals Act (CFIA).

- 6.7.3 Where preventive practices and vaccines are inadequate to prevent sickness or injury and where disease and health problems require treatment, the use of biological, cultural, and physical treatments and practices is permitted, in accordance with CAN/CGSB-32.311.
- 6.7.4 Medical treatment for sick or injured livestock shall not be withheld to preserve their organic status. All appropriate medications shall be used to restore livestock to health when methods acceptable to organic production fail. Shipping of diseased livestock to slaughter for human consumption is prohibited. Sick and medicated animals shall be quarantined from healthy livestock.
- 6.7.5 Milk from sick animals or those undergoing treatment with restricted substances cannot be sold as organic or fed to organic livestock.
- 6.7.6 The use of veterinary medicinal substances in organic production systems shall conform to the following:
- If no alternative treatment or management practice exists, the use of veterinary biologics, including vaccines, the use of parasiticides or the therapeutic use of synthetic medications may be administered provided that such medications are allowed, in accordance with this standard, or are required by law.
 - Phytotherapeutic (i.e. herbal or botanical substances excluding antibiotics), homeopathic or similar products shall be used in preference to chemical allopathic veterinary drugs or antibiotics, provided that their therapeutic effect is effective for the species and the condition for which the treatment is intended.
 - If the use of the products in par. 6.7.6 a. and b. is unlikely to be effective in combatting illness or injury, chemical allopathic veterinary drugs or antibiotics (not listed in CAN/CGSB-32.311) may be administered under veterinary supervision; meat animals so treated are considered non-organic.
 - The use of chemical allopathic veterinary drugs (e.g. pharmaceuticals, antibiotics, hormones and steroids) for preventive treatments is prohibited.
- 6.7.7 Hormonal treatment shall only be used for therapeutic reasons and under veterinary supervision. The meat from animals so treated cannot be sold as organic meat.
- 6.7.8 The operator of an organic livestock operation shall not administer
- veterinary drugs, other than vaccinations, in the absence of illness, with the exception of anaesthetics used in permitted surgical procedures;
 - synthetic compounds to stimulate or retard growth or production, including hormones for growth promotion;
 - synthetic parasiticides to meat animals, except as provided in par. 6.7.9;
 - veterinary drugs in violation of regulations;
 - antibiotics to meat animals.
- 6.7.9 Organic livestock operations shall have a comprehensive plan to minimize internal parasite problems in livestock.
- The plan will include preventive measures such as pasture management and fecal monitoring, as well as emergency measures in the event of a parasite outbreak. Parasite control plans shall be approved by the certification body.
 - By way of derogation, when preventive measures fail (because of climatic conditions or other uncontrollable factors), the operator may use anthelmintics (parasiticides) not listed in CAN/CGSB-32.311 providing
 - fecal samples indicate the herd is infected with parasites;
 - the operator has received written instructions from a veterinarian indicating the product and method for parasite control that shall be used;
 - the operator receives written permission from the certification body;
 - withdrawal times shall be twice the legal requirement;
 - there shall be only one treatment for slaughter animals under a year old and a maximum of two treatments per year for older slaughter animals. Slaughter animals that require further treatment will lose certified organic status. Dairy animals requiring more than two treatments per year (of combined antibiotics and parasiticides) will lose certified organic status and shall go through a 12-month transition. In this case, the dairy animal shall never be certified for slaughter purposes;

- vi. under this derogation, a dam may be treated during gestation;
- vii. the operator shall provide a written action plan to the certification body (including timing), describing how they will amend their parasite control plan, to avoid similar emergencies.
- c. This derogation shall be in effect until December 31, 2008.

- 6.7.10 As a last resort, antibiotic treatment of dairy animals is permitted in emergencies under the following conditions:
- a. The operator shall have written instructions from a veterinarian indicating the product used and the treatment method.
 - b. Such treatment shall result in a milk withdrawal time of at least 14 days or two times the specific medication's withdrawal period, whichever is longer.
 - c. Last resort antibiotic use shall be documented in herd health records.
 - d. Dairy animals shall undergo only two treatments (of combined parasiticides and antibiotics) per year. Dairy animals that require more than two treatments shall undergo a 12-month transition period.
 - e. Dairy animals with chronic conditions requiring repeated use of this practice shall be removed from the herd.

- 6.7.11 Except as provided in par. 6.7.9, no breeding or dairy animal treated with a parasiticide or veterinary drug (not listed in CAN/CGSB-32.311) shall be sold as an organic meat animal.

- 6.7.12 Injured, diseased or sick animals shall receive individual treatment designed to minimize pain and suffering, which may include euthanasia.

- 6.7.13 Forced moulting of poultry is prohibited.

6.8 **Livestock Living Conditions**

- 6.8.1 The operator of an organic livestock operation shall establish and maintain animal living-conditions that accommodate the health and natural behaviour of all animals, including

- a. access to the outdoors, shade, shelter, rotational pasture, exercise areas, fresh air and natural daylight suitable to the species, its stage of production, the climate and the environment;
- b. access to fresh water and high-quality feed in accordance with the needs of the animal;
- c. sufficient space and freedom to lie down in full lateral recumbency, stand up, stretch their limbs and turn freely, and express normal patterns of behaviour;
- d. space allowances appropriate to local conditions, feed production capacity, livestock health, nutrient balance of livestock and soils, and environmental impact;
- e. production techniques that foster the long-term health of livestock, especially where animals are required to provide a high level of production or rate of growth;
- f. appropriate resting and bedding areas in accordance with the needs of the animal;
- g. livestock housing shall have non-slip floors. The floor shall not be entirely of slatted or grid construction. Buildings shall have areas for bedding and resting that are sufficiently large, solidly built, comfortable, clean and dry. They shall be covered with a thick layer of dry bedding that can absorb excrement. Where bedding material is typically consumed by the animal species, it shall conform to the feed requirements of this standard;
- h. the outdoor stocking density of pasture and runs shall be low enough to prevent soil degradation by the livestock and overgrazing of vegetation.

- 6.8.2 Herbivores shall have access to pasture, weather permitting. The certification body may grant exceptions for access of bulls to pasture and for the final fattening phase.

- 6.8.3 The operator of an organic poultry operation shall establish and maintain poultry living conditions that accommodate the health and natural behaviour of poultry:

- a. The keeping of poultry in cages is not permitted.
- b. Poultry shall be reared in open-range conditions and have free access to pasture, open-air runs, waterways and other exercise areas subject to the species, weather, parasites, predators and ground conditions and, whenever possible, shall have such access for at least one third of their life. Open-air runs shall
 - i. be covered with vegetation and periodically left empty (and seeded if necessary) to allow vegetation to re-grow to prevent disease build-up;

- ii. be provided with protective facilities;
- iii. permit animals to have access to an adequate number of drinking and feeding troughs.

- 6.8.4 The operator of an organic livestock operation may provide temporary confinement for livestock owing to
- a. inclement weather;
 - b. animal's stage of production;
 - c. conditions where the health, safety or well-being of the animal could be jeopardized given its stage of production;
 - d. risks relating to soil, water or plant quality.
- 6.8.5 Housing, pens, runs, equipment and utensils shall be properly cleaned and disinfected to prevent cross infection and build-up of disease-carrying organisms.
- 6.8.6 The keeping of rabbits in cages is not permitted.
- 6.8.7 Animals reared in accordance with the provisions of this standard may be grazed with other animals on common land (i.e. crown range or community pasture), provided that
- a. this land has not been treated with products other than those allowed in accordance with this standard for at least three years;
 - b. health care and feed products available to organic livestock on common land shall be in accordance with this standard;
 - c. identification permits clear distinction between organically raised animals and non-organically raised animals.
- 6.8.8 For poultry, buildings shall be emptied, cleaned and disinfected, and runs left empty to allow the vegetation to grow back between flocks.
- 6.8.9 ***Housing of Dairy Calves***
- 6.8.9.1 The housing of calves in individual pens is not permitted without the approval of the certification body. When permitted,
- a. calves may be housed in individual pens until three months of age, providing that they have enough room to turn around, lie down, stretch out when lying down, get up, rest and groom themselves;
 - b. individual calf pens shall be designed and located so that each calf can see, smell and hear other calves.
- 6.8.9.2 Calves shall be group-housed following weaning.
- 6.8.9.3 Calves over six months of age shall have access to the outdoors and pasture.
- 6.8.10 The continuous tethering of livestock is not permitted without the approval of the certification body.
- 6.8.11 Sows shall be kept in groups, except in the last stages of pregnancy and during the suckling period. Piglets shall not be kept on flat decks or in piglet cages. Exercise areas shall permit rooting by the animals.
- 6.8.12 All livestock in single production units shall be reared in accordance with this standard. Other non-organic livestock production units may be present in the establishment if they are clearly identified and kept separate from organic livestock production.
- 6.8.13 Table 1 specifies minimum indoor and outdoor space requirements for barns, pens, runs and exercise areas. It does not include pasture requirements.

TABLE 1
Livestock Stocking Rate

Livestock	Indoor Space	Outdoor Runs and Pens
Adult cows	6 m ² /head	9 m ² /head
Calves	Incremental increase of 1.5 m ² /head for young calves to 5 m ² /head for growing (1-year old) steers and heifers	5 m ² /head to 9 m ² /head, depending on the size of animals
Sheep and goats	1.5 m ² /head plus 0.35 m ² /head for each additional lamb/kid	2.5 m ² /head plus 0.5 m ² /head for each additional lamb/kid
Sows and piglets (up to 40 days' old)	7.5 m ² for each sow and litter	2.5 m ² for each sow and litter
Growing pigs	Incremental increase from 0.6 m ² /head at weaning to 1.3 m ² /head at finishing or breeding size	Incremental increase from 0.4 m ² /head at weaning to 1 m ² /head at finishing or breeding size
Sows in group pens	3 m ² /head	3 m ² /head
Boars in individual pens	8 m ² /head	8 m ² /head
Laying hens	6 birds/m ²	4 birds/m ²
Broilers	10 birds/m ²	4 birds/m ²
Turkeys, geese and large birds	2 m ² /bird	7.4 m ² /bird over 10 weeks' old
Mobile poultry units (moved daily)		
Laying hens		6 birds/m ²
Broilers		10 birds/m ²
Turkeys		3 birds/m ²
Ducks		10 birds/m ²
Geese		3 birds/m ²
Young rabbits	0.3 m ² /head	2 m ² /head
Doe rabbits	0.5 m ² /head	2 m ² /head

6.9 **Manure Management**

6.9.1 Manure management practices used to maintain areas in which livestock are housed, penned or pastured shall be implemented in a manner that minimizes soil and water degradation.

6.9.2 All manure storage and handling facilities, including composting facilities, shall be designed, constructed and operated to prevent contamination of ground and surface water.

6.10 **Pest Management** — Pest management shall involve in descending order of preference

- a. preventive methods;
- b. mechanical, physical and biological control methods;
- c. the use of pesticides included in CAN/CGSB-32.311.

7. SPECIFIC PRODUCTION REQUIREMENTS

7.1 Apiculture

7.1.1 An operator may introduce and manage bees on the enterprise for production benefits, such as the pollination of organic crops. If managed as a livestock species yielding apiculture products (e.g. honey, pollen, propolis, royal jelly, beeswax and bee venom) to be sold, labelled or represented as organic, the operator shall manage bees in accordance with this standard.

7.1.2 The treatment and management of colonies shall respect the principles of organic production.

7.1.3 The sources of nectar, honeydew and pollen shall consist mainly of organically produced plants and spontaneous (wild) vegetation.

7.1.4 The management of bee health shall be based on appropriate measures such as selection of stock with disease-resistant traits, availability of suitable forage, and good apiary management practices.

7.1.5 When bees are placed in wild areas, consideration shall be given to the indigenous insect population.

7.1.6 An operator of an organic apicultural enterprise shall prepare an organic plan providing a detailed description of the sources of bees and production methods. The plan shall include a description of colony management for diet, disease, pests, breeding and related problems with production, in accordance with this standard. The operator shall also outline the details of crop management practices, where applicable.

7.1.7 *Transition*

7.1.7.1 Products from an organic apiculture operation in accordance with this standard shall be from colonies that have been under continuous organic management for not less than one year before the extraction or removal of the first products from the hive.

7.1.7.2 During the transition period, non-organic wax shall be replaced by organically produced wax. In cases where no prohibited substances have previously been used within the hive in accordance with this standard, the replacement of wax is not necessary. In cases where all wax cannot be replaced during the transition period, the transition period may be extended.

7.1.7.3 Colonies and hives shall not be rotated between organic and non-organic management systems, except for colonies that have undergone a one-year transition after isolation and antibiotic treatment as described in par. 7.1.14.7.

7.1.8 *Origin of Bees*

7.1.8.1 The term *introduced bees* refers to replacement bees for established organic colonies — introduced bees are not established colonies. Introduced bees shall come from organic production units when commercially available. However, replacement bees (e.g. package bees or nucleus colonies) may be from organic sources or from non-organic sources provided that replacement bees are managed in accordance with this standard for at least 60 days before the removal of organic apiculture products from the hive.

7.1.8.2 Honey and other apiculture products shall not be labelled or marketed as organic unless the bees were managed in accordance with this standard for at least 60 days.

7.1.9 *Location of Hives* — Apiaries shall be separated by a buffer zone of 3000 m where sources or zones of prohibited substances, or flower-bearing agricultural crops treated with substances prohibited in CAN/CGSB-32.311 (i.e. genetic engineering or environmental contaminants) are present.

7.1.10 *Forage and Feeding*

7.1.10.1 The operator shall provide bees with adequate forage and water that are managed in accordance with this standard.

7.1.10.2 Owing to the long distances that foraging bees may travel, it is not possible to limit foraging activities to organic floral sources. While placement of colonies on an organic enterprise, in accordance with this standard, is preferable,

hives may be located in other foraging sites, provided the operator can demonstrate that the area surrounding the foraging site is not treated or exposed to substances not in accordance with this standard.

- 7.1.10.3 Organic honey shall be the major foodstuff for adult bees.
- a. The feeding of colonies can be undertaken to overcome temporary feed shortages owing to climatic or other exceptional circumstances. Feeding shall be carried out only between the last honey harvest and 15 days before the start of the next nectar or honeydew flow-period.
 - b. In such cases, organically produced honey or sugars shall be used if commercially available. If unavailable, the certification body may permit the use of non-organically produced honey or sugars for a specified time limit.
- 7.1.10.4 Organic sugar syrup shall not be provided less than 30 days before the harvest of honey to be sold, labelled or represented as organic, in accordance with this standard.
- 7.1.10.5 Honey and pollen shall be maintained in adequate supplies in the colony, including leaving colonies with reserves of honey and pollen sufficient for the colony to survive the dormancy period.
- 7.1.11 ***Colony Management***
- 7.1.11.1 Hives shall be individually identifiable (marked) and shall be monitored regularly (i.e. at one- to two-week intervals, depending upon the colony, weather conditions and time of year).
- 7.1.11.2 Records shall be maintained in accordance with this standard that document all apiary management activities, including removal of supers and extraction of honey.
- 7.1.11.3 Clipping of wings on queen bees is prohibited.
- 7.1.11.4 Bees shall be removed from hives with bee escape-boards, shaking, brushing and forced-air blowers.
- 7.1.11.5 Synthetic materials in bee smokers are prohibited in accordance with par. 1.8.
- 7.1.11.6 Annual destruction of bee colonies following honey flows is prohibited.
- 7.1.12 ***Hive Construction***
- 7.1.12.1 Hives shall be constructed of natural materials, including wood and metal. Pressure-treated lumber or particleboard, wood preservatives and lumber treated with substances not in accordance with this standard shall not be used in hive construction or maintenance.
- 7.1.12.2 Exterior surfaces of the hive shall be painted only with non-lead-based paints.
- 7.1.12.3 Plastic foundation, if dipped in organic beeswax, is permitted.
- 7.1.13 ***Health Care***
- 7.1.13.1 Preventive health-care practices shall be established and maintained, including the selection of bee stocks resistant to prevalent diseases and pests; the selection of colony locations appropriate to site-specific conditions; the availability of sufficient pollen and honey; the renewal of beeswax; the disinfection and regular cleaning of equipment; and the destruction of contaminated hives and materials.
- 7.1.13.2 The operator shall promote strong colonies and unite weaker, albeit healthy, colonies wherever possible, including renewal of queens if necessary; maintenance of adequate hive densities; systematic inspection of colonies; and relocation of diseased colonies to isolated areas.
- 7.1.14 ***Disease and Pest Management***
- 7.1.14.1 The operator shall be knowledgeable about the life cycle and the behaviour of the bee, as well as related disease-causing organisms, parasitic mites and other pests. The operator shall also initiate efforts to restore the health of the colony in the presence of such pests, parasites or disease.

- 7.1.14.2 Every effort shall be made to breed and select queen bees for resistance to diseases and parasites, and to take preventive measures to control disease and pest problems.
- 7.1.14.3 Comb foundation shall be obtained from beeswax of the enterprise apiary or from other organic sources certified in accordance with this standard, where commercially available.
- 7.1.14.4 The operator shall use management methods or modified equipment to control pests and diseases.
- 7.1.14.5 Botanical compounds may be introduced into the hive provided that such remedies are in accordance with this standard and are not used within 30 days of honey flow or whenever honey supers are on the hive.
- 7.1.14.6 The use of therapeutic applications of non-synthetic or synthetic substances to control pests, parasites and diseases is permitted, provided that such substances are in accordance with CAN/CGSB-32.311.
- 7.1.14.7 The use of synthetic allopathic drugs (e.g. antibiotics) in organic apicultural production systems is prohibited. However, where the imminent health of the colony is threatened, such substances are allowed in accordance with CAN/CGSB-32.311 and par. 7.1.14.8. Treated hives shall be placed in isolation and undergo a one-year transition period. All the wax shall be replaced with wax that is in accordance with this standard, and all veterinary treatments shall be clearly documented. Before such treatments, the hive shall be removed from the foraging area and taken out of organic production to prevent the spread of antibiotics within the apiary.
- 7.1.14.8 The practice of destroying the male brood is permitted only to contain infestation with varroa mites.

7.1.15 ***Extraction, Processing and Storage***

- 7.1.15.1 Extraction of honey from a brood comb with a live brood is prohibited.
- 7.1.15.2 The operator shall preserve and protect the quality and organic integrity of the honey, produced in accordance with this standard, once it is harvested.
- 7.1.15.3 Surfaces in direct contact with honey shall be constructed of food-grade materials or coated with beeswax.
- 7.1.15.4 The heating of honey for extraction shall not exceed 35°C, and the decrystallization temperature shall not exceed 47°C.
- 7.1.15.5 Gravitational settling shall be used to remove debris from extracted honey; sieves are permitted to remove residual debris.
- 7.1.15.6 Honey shall be packaged in airtight containers.
- 7.1.15.7 Cleaning products and insect repellents shall be limited to substances listed in CAN/CGSB-32.311.
- 7.1.15.8 The operator, in accordance with this standard, shall not sell, label or represent as organic, honey or edible products that are produced from a hive or colony treated with prohibited substances.

7.2 **Maple Products**

- 7.2.1 For maple products to be sold, labelled or represented as organic, the operator shall manage production units in accordance with this standard.
- 7.2.2 In the production of maple syrup or products derived from it, care shall be taken to ensure that the characteristic maple flavour predominates. Organic standards shall be respected during all stages of maple syrup production — the maintenance and development of the sugar bush, the collection and storing of the maple sap, and the processing of the sap into syrup and derived products. This includes the washing and the sterilization of equipment and the storage of finished products.
- 7.2.3 For sugar bush development and maintenance, the production of organic maple syrup shall be characterized by management practices that respect the sugar bush and its ecosystem. Development and maintenance shall be focused on preserving the ecosystem of the sugar bush and on improving the vigour of the tree population over the long term.

- 7.2.4 Tapping practices shall aim to minimize the risks to the health and longevity of the trees.
- 7.2.5 For the collection and storage of maple sap, the equipment and techniques shall aim to obtain a processed product of the highest possible quality. Equipment shall be in good condition and shall be used according to the manufacturer's instructions.
- 7.2.6 In converting sap to syrup, the sap can take on the odour of anything it comes into contact with during its processing. Care shall be taken to avoid denaturing the product at any point in the processing. Therefore, the use of any technology likely to alter the intrinsic qualities of the product is prohibited.
- 7.2.7 The cleaning of equipment used in syrup production including the collection system, pipes and tanks shall take place before and after each production run.
- 7.2.8 **Transition** — For maple products to be designated as organic, no prohibited substances, such as unapproved fertilizers or synthetic pesticides used in forest management, shall be used on the sugar bush or in production within 36 months preceding any harvest. The transition period may be reduced to one year if it is a managed wilderness area. There shall not be any parallel production within any area.
- 7.2.9 **Sugar Bush Development and Maintenance**
- 7.2.9.1 **Plant Diversity** — Producers shall encourage species diversity in the sugar bush, in particular companion species to the sugar maple.
- 7.2.9.2 **Thinning** — When it is necessary, or when required by the administrator of the forest, thinning of the sugar bush shall be reduced to the strict minimum as well as being well distributed throughout the sugar bush. For clearings larger than those prescribed in this standard, the operator shall make use of professional services that will respect maple forest standards, as those applied to land on public property.
- 7.2.9.3 **Tree Protection** — To preserve plant diversity and the growth of young trees, access to the sugar bush by farm animals (e.g. beef or dairy cattle, pigs or domestic deer) is forbidden at all times. The pipeline network shall be installed so as not to wound or harm the growth of the trees.
- 7.2.9.4 **Fertilization** — Fertilization shall only be applied using recommendations based on observed, diagnosed and documented deficiencies. Authorized soil amendments for sugar bushes include wood ash, agricultural lime and non-synthetic fertilizers listed in CAN/CGSB-32.311.
- 7.2.9.5 **Pest Control** — Understanding the habits of the pests that may attack the sugar bush or production facilities, and seeking harmonious solutions to these attacks, are the preferred basis for pest control. For rodents and other destructive pests, mechanical and sticky traps are permitted, as are natural repellents in accordance with CAN/CGSB-32.311. When populations are too high, they may be hunted. Poisons of any kind are prohibited. Only products appearing in CAN/CGSB-32.311 shall be used to control diseases or insects within the sugar bush.
- 7.2.10 **Tapping**
- 7.2.10.1 **Tree Diameter and Number of Taps** — Table 2 indicates the maximum number of taps that a healthy maple can support, based on its chest height diameter (C.H.D.). C.H.D. is the tree's diameter measured at a height of 1.3 m above the soil surface. No maple can receive more than three tapholes.

TABLE 2
Maximum Number of Taps

Diameter Measured at a Height of 1.3 m Above the Soil Surface	Maximum Number of Taps
Less than 20 cm	0
20 to 40 cm	1
40 to 60 cm	2
60 cm or greater	3

- 7.2.10.2 *Depth and Diameter of Tapholes* — The depth of tapholes shall be no more than 4 cm, not counting the bark, or 6 cm if the measurement is made from the surface of the bark. Taphole diameters shall not be greater than 11 mm.
- 7.2.10.3 *Disinfection of Tapholes and Tapping Equipment* — The use of any type of germicide, including paraformaldehyde tablets, or denatured alcohol (a mixture of ethanol and ethyl acetate), in tapholes and on tapping equipment, is prohibited. If it is absolutely necessary to use a disinfectant during tapping, only food-grade ethyl alcohol, applied by sprinkling it on spouts and in notches, may be authorized by the certification body, as an exemption for an explicit reason.
- 7.2.10.4 *Over- and Under-tapping* — Double tapping, the practice of retapping a previously tapped tree during the same season, is a prohibited practice. Spouts shall be removed from the trees at the end of the production season, to allow the trees to heal.
- 7.2.11 ***Collection and Storage of Maple Syrup***
- 7.2.11.1 *Spouts* — Only the use of spouts made of food-grade materials is permitted.
- 7.2.11.2 *Sap Collection Under Vacuum* — All parts of the collection system that may come in contact with the sap shall be made with materials suitable for use in the manufacture of an organic product. The vacuum level shall never exceed 677 hPa (20 in. of mercury) at any spout.
- 7.2.11.3 *Storage* — All equipment that may come in contact with the sap or its concentrate and filtrates, such as storage tanks, connections and transfer systems, shall be made with materials suitable for use in the manufacture of food products. This also applies to any surface coatings (e.g. paints), where applicable.
- 7.2.11.4 *Collecting with Buckets* — Pails or buckets may be made of aluminum or plastic, but not galvanized steel. A lid shall be used to cover the bucket. The same standards that apply to storage tanks apply to reservoirs used to transport the collected sap to the place where it will be boiled.
- 7.2.12 ***Conversion of Sap to Syrup***
- 7.2.12.1 *Sap Filtration* — Sap shall be filtered before processing. This filtration shall not take away the sap's inherent qualities.
- 7.2.12.2 *Sap Sterilization* — Sterilization of the sap before its conversion to syrup is forbidden, either by treating it with ultraviolet radiation or by adding any type of product.
- 7.2.12.3 *Osmosis Extraction and Membranes* — The reverse osmosis technique of sap concentration is acceptable. Only membranes of the reverse osmosis and nano-filtration (ultra-osmosis) types are allowed. In the off-season, osmosis membranes shall be stored in filtrate in a hermetically sealed container kept in a frost-free location. Sodium metabisulfite (SMBS) may be added to the filtrate to prevent mould growth. In such cases, the membrane shall be rinsed before its use the next spring with a volume of water equal to the hourly capacity of the membrane (e.g. 2728 L [600 gal.] of water for a 2728 L/h [600 gal./h] membrane). Off-site storage of the membrane (e.g. by the membrane supplier) shall be documented.
- 7.2.12.4 *Evaporator* — Evaporator pans shall be made of stainless steel. They shall be either tungsten-inert gas (TIG) welded or soldered using tin-silver solder. If soldered joints are made using tin-lead solder, the concentrate shall not remain in the pans for more than 24 hours. Pans made of galvanized steel, copper, aluminum and tin-plated steel are not allowed. Acceptable fuels include wood and heating oil. Used oils may be used as a primary or supplementary fuel for the evaporator if the enterprise possesses the necessary permits for this. Air and environmental quality shall be controlled in the evaporator room. Also, the use of air injection systems is prohibited.
- 7.2.12.5 *Defoamers* — The only antifoaming agents permitted are Pennsylvania maple wood (*Acer pennsylvanicum*, also known as striped maple or moosewood) and all organic vegetable oils, except those made from soy, peanuts, sesame seeds or nuts because they can cause an allergic reaction. The certification body may approve, as an exception, the use of other products only if the operator is able to demonstrate that no authorized antifoaming agents above mentioned were commercially available and if so, the operator shall indicate the allergic potential on the label of his/her maple syrup products.

- 7.2.12.6 *Syrup Filtration* — Silica powder, clay dust and diatomaceous earth are acceptable for use in the filter presses used to filter the finished syrup.
- 7.2.12.7 *Provisional Containers* — The maple syrup not intended for immediate consumption shall be packed in containers of food-grade materials that do not alter the chemical composition or the quality of the syrup. Authorized containers include barrels made of stainless steel, fibreglass, food-grade plastic or metal with a food-grade coating inside. The syrup can be packed in galvanized barrels for a maximum of 60 days if its Brix degree is lower or equal to 65, and for a maximum of 120 days if its Brix degree is superior to 65. All barrels shall carry a unique number, with a corresponding entry appearing in the record books of the producer. The date of fill-up shall also be recorded.
- 7.2.13 ***Cleaning of Equipment Intended for Use with Syrup Production***
- 7.2.13.1 *Authorized Products for Cleaning or Disinfecting* — When operators need to carry out cleaning or disinfecting operations in addition to washing, the products authorized include
- in season, a filtrate for all equipment and sodium hypochlorite for all equipment except the piping;
 - out of season, filtrate, sodium hypochlorite and fermented sap for all equipment.
- 7.2.13.2 *Prohibited Products* — All other products are prohibited, including those based on phosphoric acid.
- 7.2.13.3 *Osmosis Unit Membrane* — Operators shall follow the manufacturer's recommendations for products used to maintain reverse osmosis unit membranes. They shall be rinsed using a filtrate having a volume equivalent to 40 times an apparatus' residual void volume, meaning the volume contained in the apparatus and its components once the apparatus has been drained. Daily effectiveness records and calculations shall be recorded in daily record books. The membrane flushing water shall be discarded in a manner that causes no harm to the environment.
- 7.2.13.4 *Evaporators* — Evaporators may be washed with drinking water at any time. Vinegar or fermented sap may be used at end of season.
- 7.2.14 ***Food Additives and Processing Aids*** — Transformation of syrup into derivative products (e.g. maple butter, sugar and taffy) shall respect this standard. Cooking using microwaves is forbidden. No other product shall be added to syrup or other maple products during their production, whether to improve the taste, texture or appearance. Cones may be used if they constitute less than 5% of the weight of the final product.
- 7.2.15 ***Transport, Storage and Conservation*** — Maple syrup sold in bulk shall be stored in containers of food-grade materials that do not alter the chemical composition or quality of the syrup. Authorized containers include barrels made of stainless steel, fibreglass, food-grade plastic or metal with a food-grade coating inside. All barrels shall carry a unique number, with a corresponding entry appearing in the record books of the producer.

7.3 **Mushroom Production**

- 7.3.1 For mushrooms or mushroom products to be sold, labelled or represented as organic, the operator shall manage production units in a manner that ensures the substrates and mushrooms are not in contact with prohibited substances. Substrates shall be produced in accordance with this standard or obtained from vegetation grown in areas free of prohibited substances for at least three years and shall be composted in accordance with this standard.
- 7.3.2 In the production of organic mushrooms, the operator shall
- ensure, for new installations or replacement purposes, that only lumber that has not been treated with prohibited substances is in contact with the growth substrate;
 - maintain an environment throughout the entire growing cycle, harvesting, and post-harvesting process that prevents contact between organically produced mushrooms and prohibited substances, in accordance with this standard;
 - use as a production substrate, organic agricultural substances that are in accordance with this standard (e.g. organic straw or hay);
 - use as a growth substrate, logs, sawdust or other materials derived from wood originating only from trees that have been grown in areas free of prohibited substances, in accordance with this standard, for at least three years and that have not been treated post-harvest with prohibited substances;

- e. use organic spawn (seed), or if not commercially available, organic or non-organic spawn provided that it has not been treated with a prohibited substance and has been produced in accordance with this standard;
- f. ensure that manure and any non-organic agricultural material used as a growth substrate is composted, in accordance with this standard;
- g. ensure that cultivation sites are free of debris from understorey and diseased trees;
- h. ensure that diseased mushroom strains are either burned, moved at least 50 m from a production site (if the diseased logs are kept for study), or moved to an acceptable disposal area;
- i. precautions shall be taken to prevent disease including the removal of diseased materials and sanitation using substances included in CAN/CGSB-32.311.

7.3.3 The cleaning and maintenance of equipment and the use of sanitizers and disinfectants shall be limited to substances included in CAN/CGSB-32.311.

7.4 **Sprout Production**

7.4.1 For sprouts or sprout products to be sold, labelled or represented as organic, the operator shall manage production units by using seed produced in accordance with this standard and water that meets or exceeds the quality guidelines for drinking water.

7.4.2 Seed and sprouts shall not be rinsed with or come in contact with prohibited substances, and the sanitation of equipment shall involve the use of substances listed in CAN/CGSB-32.311.

7.4.3 In the production of organic sprouts, the operator shall

- a. use only seed produced under organic production methods, in accordance with this standard;
- b. use sources of water (e.g. potable water, distilled or processed by osmosis) that meet or exceed the quality standards for levels of microbial and chemical contaminants in drinking water;
- c. assess water quality regularly by an analytical laboratory to assure standards of water quality.

7.4.4 Seed or growing sprouts shall not be rinsed or immersed in water with chemicals capable of releasing chlorine in solution, in excess of water quality guidelines.

7.4.5 The cleaning and maintenance of equipment and the use of sanitizers and disinfectants shall be limited to substances included in CAN/CGSB-32.311.

7.5 **Greenhouse Crops Production**

7.5.1 For greenhouse products to be sold, labelled or represented as organic, the operator shall manage soil and crop production units with an in-ground, permanent soil system or with a container system with soil free of prohibited substances. Construction materials shall not include biodegradable plastics or wood treated with prohibited substances. The growing medium shall be free of prohibited substances, and the soil shall be free of prohibited substances for at least three years before use.

7.5.2 The operator may use supplemental heat with proper exhaust of burnt gasses, and supplemental lighting. Supplemental nutrition may be used in accordance with CAN/CGSB-32.311. However, composted animal manure shall be the primary source of nutrients.

7.5.3 Plants and soil, including potting soil, shall not be in contact with prohibited substances, including wood used for greenhouse structures or frames of raised beds treated with such substances.

7.5.4 The operator shall

- a. use reusable and recyclable pots and flats whenever possible;
- b. use growing media and wetting agents selected from substances listed in CAN/CGSB-32.311;
- c. disinfect holding or storage facilities and equipment using only substances listed in CAN/CGSB-32.311.

7.5.5 Full-spectrum lighting is permitted.

- 7.5.6 The following procedures or processes are allowed to
- a. enrich carbon dioxide levels:
 - i. flame
 - ii. fermentation
 - iii. composting
 - iv. compressed gas (CO₂)
 - b. clean and disinfect plant containers, pots and flats:
 - i. substances listed in CAN/CGSB-32.311
 - ii. steam-heat sterilization
 - c. stimulate growth or development:
 - i. plant-based growth regulators
 - ii. animal-based growth regulators
 - iii. control of daily temperature and light levels
 - d. prevent damping-off:
 - i. low-temperature baking
 - ii. hot-water treatment
 - iii. steam treatment
- 7.5.7 For the prevention and control of disease, insects or other pests, the following procedures are allowed:
- a. methods and substances listed in CAN/CGSB-32.311
 - b. pruning
 - c. roguing
 - d. vacuuming
 - e. air filters, screens or other physical devices to exclude pests from the greenhouse environment
- 7.5.8 Soil regeneration and recycling procedures shall be practiced. Alternatives to crop rotation may be permitted in greenhouse production, such as grafting of plants on disease-resistant rootstock, winter soil-freezing, soil regeneration by incorporating biodegradable plant mulch (e.g. straw or hay), and partial or complete replacement of greenhouse soil, provided it is re-used outside the greenhouse for another crop.
- 7.5.9 For operations where the plants are not growing in the ground, a biologically active growing-medium shall be evident at the end of each growth cycle.
- 7.6 **Wild Crops**
- 7.6.1 A wild plant product that is intended to be sold, labelled or represented as organic in accordance with this standard shall be harvested from a clearly defined production area having documentation that no prohibited substances have been applied for a period of three years immediately preceding the harvest of the wild crop.
- 7.6.2 To be able to label and market organic wild plant products, the operator shall
- a. draw up a detailed description of harvested areas and the history of compliance with this standard over the past three years;
 - b. draw up a description of harvest methods used;
 - c. propose protection measures for wild species that will prevent disturbance of the environment.
- 7.6.3 Wild products can only be deemed organic, in accordance with this standard, if they are harvested in relatively undisturbed or stable natural settings. A wild plant shall be harvested or picked in a way that promotes its growth and production and that does not destroy the environment.
- 7.6.4 The production zone of wild crops shall be isolated from non-production zones by a clearly defined buffer zone.
- 7.6.5 The operator that manages the harvest of wild crop products shall maintain auditable records.
- 7.6.6 Wild crops produced and harvested in accordance with this standard may be combined with organic products during preparation and may be identified and labelled as organic.

8. PREPARATION AND HANDLING OF ORGANIC PRODUCTS

8.1 **Integrity** — The major objective of an organic system is to maintain the inherent organic qualities of the product from production, preparation, storage, handling and labelling, to point of sale. Throughout the preparation and handling, the integrity of organic products is maintained by using techniques appropriate to the specific ingredients and limiting the degree of refinement while minimizing the use of food additives and processing aids. Ionizing radiation shall not be used on organic products for pest control, food preservation, and elimination of pathogens or sanitation.

8.1.1 Processors importing organic ingredients shall ensure that the ingredients meet this standard.

8.1.2 By way of derogation to par. 8.1.1, the following will apply:

- a. If the end product is destined for export only, the ingredients need not meet this standard.
- b. If an organic ingredient is not produced in Canada, imported ingredients not meeting this standard that are certified by a certification body recognized by the Canadian competent authority are acceptable. Certification must be based on an organic standard approved by a government authority or by using a set of specifications approved by the Canadian competent authority.

8.2 Pest Management

8.2.1 Good manufacturing practices shall be adopted to prevent pests. Pest management practices shall first involve the removal of pest habitat and food; second, the prevention of access and environmental management (light, temperature and atmosphere) to prevent pest intrusion and reproduction; and third, mechanical and physical methods (traps), lures and repellents listed in CAN/CGSB-32.311.

8.2.2 If the practices given in par. 8.2.1 are ineffective, the operation may use pest control substances listed in CAN/CGSB-32.311. The operator shall, however, ensure that any pest control substance used does not come in contact with the organic product, and shall record the use and disposition of all such substances.

8.2.3 The use of pesticides not listed in CAN/CGSB-32.311 for post harvest or quarantine purposes shall not be permitted on products prepared in accordance with this standard and shall cause organic products to lose their organic status.

8.3 Processing and Handling

8.3.1 Processing methods shall be mechanical, physical or biological (e.g. fermentation and smoking) and shall minimize the use of non-agricultural ingredients, food additives and processing aids in CAN/CGSB-32.311.

8.3.2 Food additives and processing aids shall be of organic origin, wherever possible, in accordance with par. 11.2.4 and CAN/CGSB-32.311.

8.3.3 Food additives and processing aids shall only be used to maintain

- a. nutritional value;
- b. food quality or stability;
- c. composition, consistency and appearance, provided that their use does not mislead the consumer concerning the nature, substance and quality of the food; and
 - i. there is no possibility of producing a similar product without the use of additives or processing aids;
 - ii. they are not included in amounts greater than the minimum required to achieve the function for which they are permitted;
 - iii. they contain no other substances prohibited in accordance with this standard.

8.3.4 Organic products shall be packaged with materials that prevent commingling, contamination and pest infestation and do not cause a loss of organic integrity.

8.3.5 Any materials in contact with food shall be clean and of food-grade quality.

8.3.6 Washing and disinfecting operations for equipment and surfaces coming into contact with food shall be followed by double rinsing with potable water, to ensure that they are free from cleaning-product residues.

- 8.3.7 Organic products, in accordance with this standard, shall be segregated or otherwise protected at all times (i.e. storage, bulk and unbound stages) from non-organic products, to prevent commingling.
- 8.3.8 Where products not in accordance with this standard are also processed, packaged or stored in the unit operated in accordance with organic production,
- a. processing shall be carried out continuously until the complete run has been dealt with, separated by place or time from similar operations performed on products not covered by this standard;
 - b. if such operations are not carried out frequently, they shall be announced in advance, with a deadline appearing in the enterprise's production schedule;
 - c. every measure shall be taken to ensure identification of lots and to avoid mixtures with products not obtained in accordance with this standard.
- 8.3.9 Storage sites and transport containers for organic products shall be maintained and cleaned using methods appropriate for the organic products being stored and with materials in accordance with this standard.
- 8.4 **Transportation** — To avoid possible commingling of organic and non-organic products at any time during transportation, organic products shall be physically segregated or protected to prevent substitution of the content.
- 8.4.1 Equipment used in transporting organic products shall be free of
- a. non-organic product (or other) residues;
 - b. invertebrate and vertebrate pests.
- 8.4.2 Organic products sold, labelled or represented as organic, in accordance with this standard, and not in retail packaging shall be transported in a manner that shall prevent contamination or substitution of the content with substances or products not compatible with this standard. Packaging shall bear the following information, without prejudice to any other indications required by law:
- a. the name and address of the person or organization responsible for the production, preparation or distribution of the product
 - b. the name of the product
 - c. the organic status of the product
 - d. information that ensures traceability (e.g. lot number)
- 8.4.3 The party owning the product at the point of transport shall be responsible for maintaining the organic integrity in the transport process unless transport operations are certified in their own capacity. Documentation shall be obtained to provide assurance that conditions meet the requirements of this standard.

9. EMERGENCY PEST OR DISEASE TREATMENT

- 9.1 When a prohibited substance is applied on an establishment because of a federal or provincial emergency program for the treatment of pests and diseases and when the establishment otherwise meets the requirements of this standard, the organic status shall not be affected provided the operator complies with the following conditions:
- a. Any treated harvested crop or plant part shall not be sold, labelled or represented as organically produced.
 - b. Any livestock treated or any products derived from such treated livestock, shall not be sold, labelled or represented as organically produced with the exception of
 - i. milk or milk products produced more than 12 months after the last date that the dairy animal was treated with a prohibited substance;
 - ii. the offspring of gestating mammalian breeder stock treated with a prohibited substance shall be considered organic if the breeder stock was not in the last third of gestation on the date that the breeder stock was treated with the prohibited substance.

10. LABELLING AND CLAIMS

- 10.1 Products identified as being produced under an organic production system conforming to this standard may, for labelling purposes, use the terms *organic*, *organically grown*, *organically raised*, *organically produced*, or words of similar intent including diminutives as well as the symbols for, alternative spellings of, word sets of, and phonetic renderings of these words.

- 10.2 The labelling and claims of unprocessed plants and plant products, livestock and livestock products shall refer to organic production methods only where
- such indications clearly show that they relate to a method of agricultural production;
 - the product was produced in accordance with this standard;
 - the product was produced or imported by an operator who is certified in compliance with this standard;
 - the labelling refers to the name of the certification body that governs the operator of the production or the most recent preparation (processing, packaging and labelling) operation.
- 10.3 The labelling and claims of processed agricultural crop and livestock products intended for human consumption (par. 10.1) shall refer to organic production methods only where
- such indications clearly show that they relate to an organic method of agricultural production and are linked with the name of the organic product in question, unless this information is clearly given in the list of ingredients;
 - all the ingredients of agricultural origin of the product are, or are derived from, products conforming to this standard, except in cases of labelling claims of less than 95% organic ingredients, as in par. 10.7.3;
 - the product is free of any ingredient of non-agricultural origin not listed in CAN/CGSB-32.311;
 - the product does not contain both the non-organic and organic form of an ingredient;
 - the product or its ingredients have not been subjected during preparation to treatments involving the use of ionizing radiation or substances not listed in CAN/CGSB-32.311;
 - the product was prepared or imported by a certified operator;
 - the labelling refers to the name of the certification body that certified the operator of the production or the most recent preparation (processing, packaging and labelling) operation.
- 10.4 The percentage of all organically produced ingredients in an organic product that is sold, labelled or represented as organic or that includes organic ingredients, in accordance with this standard, shall be calculated by the following:
- Solid Products*: Divide the total net mass (excluding water and salt) of combined organic ingredients in the formulation or finished product, whichever is more relevant, by the total mass (excluding water and salt) of all ingredients.
 - Liquid Products*: Divide the fluid volume of all organic ingredients (excluding water and salt) by the fluid volume of all ingredients (excluding water and salt) if the product and ingredients are liquid. If the liquid product is identified on the principal display panel as being reconstituted from concentrates or by similar phrases, the calculation shall be made using single-strength concentrations of the ingredients or finished product.
 - Solid Products and Liquid Products*: Divide the combined mass of solid organic ingredients and the mass of the liquid organic ingredients (excluding water and salt) by the total mass (excluding water and salt) of all ingredients in the finished product.
- 10.5 The percentage of all organically produced ingredients in an organic product shall be rounded down to the nearest whole number.
- 10.6 The total percentage of organically produced ingredients shall be determined by the operator who prepares the product and affixes the label on the consumer package and whose work has been verified by the certification body. In determining the percentage, the operator may use information provided by the organic operation that initially prepared the product.
- 10.7 **Percentage of Organic Ingredients in a Multi-ingredient Product**
- 10.7.1 The use of the term *organic*, and similar terms having the same meaning, is permitted on the principal display panel of a product, provided that
- 95% or more (by mass or fluid volume, excluding water and salt) of the ingredients are obtained from sources of organic production in accordance with this standard;
 - the non-organic ingredients are allowed for use to within a maximum level of 5% (by mass or fluid volume, excluding water and salt) of the total ingredients in the final product if they are not commercially available in an organic form, and the cost of organic ingredient(s) is not to be used as a criterion for *commercially available*.

- 10.7.2 All organic ingredients contained in the final composition of a product certified by a certification body shall have also been certified.
- 10.7.3 Products containing 70 to 95% or more (by mass or fluid volume, excluding water and salt) of agricultural ingredients that are organic in accordance with this standard shall be labelled on the principal display panel as “Contains X % organic” (specify the ingredients), where the actual organic ingredient is in accordance with this standard.
- 10.7.4 Only products containing 70% or more of organic ingredients shall be eligible for certification.
- 10.7.5 Products containing less than 70% (by mass or fluid volume, excluding water and salt) of agricultural ingredients that are organic in accordance with this standard may have the organic ingredients labelled organic in the list of ingredients.
- 10.8 The name (corporate name) of the certification body shall be inscribed on the packaging in a clear, visible way for every certified product bearing a label that mentions the terms *organic* or *made with organic ingredients*. Any reference on a product’s label that suggests the product was certified (e.g. *certified organic* or *certified by a third party*) is prohibited unless the product has been certified by a certification body whose name has been printed on the label.
- 10.9 Products containing less than 70% of organic ingredients must be subject to audit by a certification body. The labels of such products must not make any organic claims except in the list of ingredients.

11. REQUIREMENTS FOR ADDING OR AMENDING SUBSTANCES IN CAN/CGSB-32.311

- 11.1 All substances listed in or added by amendment to the Permitted Substances Lists in CAN/CGSB-32.311 shall be consistent with
- a. criteria established in par. 11.2 and existing regulations;
 - b. other provisions and principles of this standard;
 - c. the general principles of organic production.
- 11.1.1 Each substance shall be reviewed concerning its necessity and the conditions of its envisioned use. Each substance reviewed shall be accompanied by a detailed description and by all information that demonstrates conformance with par. 11.2. All available alternatives, including substances and practices that may currently be in use in other production systems, may be included in the evaluation.
- 11.1.2 Substances required for primary production shall be reviewed with the knowledge that permitted substances may be subject to misuse and may negatively affect the agroecosystem and the environment surrounding the enterprise.
- 11.1.3 The system of review criteria detailed in section 11 shall be the primary determinant for accepting or rejecting the addition of substances to the Permitted Substances Lists.
- 11.2 To amend the Permitted Substances Lists, the criteria in par. 11.2.1 to 11.2.5 and in par. 11.3 of this standard shall be used.
- 11.2.1 Substances used for the amendment of soils in an organic production system (the Permitted Substances Lists) shall be
- a. necessary for obtaining or maintaining soil fertility to fulfil specific nutritional requirements of crops, or specific soil conditioning and rotation practices that cannot be satisfied by the requirements and practices of this standard;
 - b. of plant, animal, microbial or mineral origin, in accordance with the Permitted Substances Lists, and may undergo the following processes:
 - i. physical (e.g. mechanical or thermal)
 - ii. enzymatic
 - iii. microbial (e.g. composting or digestion)

- c. manufactured and used in a manner that shall not result in, or contribute to, the damage or the contamination of the soil's microflora and microfauna, or the related agroecosystem, in accordance with the relevant regulatory authority.
- 11.2.2 Substances used in an organic production system for the management of plant growth, diseases, insects, pests and weeds or for cleaning and disinfecting facilities (the Permitted Substances Lists) shall be
- a. necessary for the control of a detrimental organism or disease for which no other adequate biological, physical or plant breeding alternatives or management practices are available;
 - b. of plant, animal, microbial or mineral origin, in accordance with the Permitted Substances Lists, and may undergo the following processes:
 - i. physical (e.g. mechanical or thermal)
 - ii. enzymatic
 - iii. microbial (e.g. composting or digestion)
 - c. used under conditions that shall not directly or indirectly result in the presence of unacceptable product residues in soils, plant or animal tissue, or products;
 - d. manufactured and used in a manner that shall not result in, or contribute to, the damage or to the contamination of the soil's microflora and microfauna or the related agroecosystem, in accordance with the relevant regulatory authority.
- 11.2.3 Substances to promote health or nutrition of organically raised livestock or to ensure the quality of organically raised livestock products (the Permitted Substances) shall be
- a. necessary for livestock health, with provisions that other organic treatments are not available;
 - b. necessary to correct documented essential nutrient deficiencies in the forage or feed ration;
 - c. exclusive of prohibited substances, in accordance with par. 1.8;
 - d. necessary for ensuring product quality, and allow for preservatives given that other biological, cultural or physical treatments are not available.
- 11.2.4 Substances added to or used in the preparation, handling and storage of organic products (the Permitted Substances Lists) shall be
- a. necessary to correct documented essential nutrient deficiencies of the product (i.e. vitamins and minerals);
 - b. essential for ensuring the safety of the product;
 - c. used only when it is not possible to process and store such products without having recourse to such ingredients.
- 11.2.5 Substances for sanitizing production and processing equipment and facilities and for emergency pest control in such facilities (the Permitted Substances Lists) shall
- a. be appropriate for the intended use;
 - b. not result in substance residues in food and feed or on food contact surfaces that exceed levels specified by government.
- 11.3 **Substance Origin** — Substances of plant and animal origin shall be derived from crops and livestock produced in accordance with this standard unless such substances are not commercially available. Substances of non-organic plant and animal origin may then be substituted if the enterprise has an action plan for procuring substances of organic origin within a reasonable time frame.
- 11.4 For all categories of substances, users of the Permitted Substances Lists shall read both the annotations on the lists and the label before using any substance. The certification body shall be consulted before using substances not on the lists. The permitted substances and the accompanying annotation (if applicable) shall be approved for use in accordance with par. 11.1.
- 11.5 All crop protection substances, parasiticides and pest control products shall be registered under the federal *Pest Control Products Act* (administered by the Pest Management Regulatory Agency [PMRA]) and except when stated, the Permitted Substances Lists do not refer to substance registration.
